Passage B - How Hard Is an Exercise Session?

A What makes a walk count as exercise? Speed matters, but it is not the whole answer. The US Centers for Disease Control and Prevention, or CDC, describes the intensity of **physical activity** as how hard a person works. Movement changes breathing and heart rate. A familiar activity can therefore require different levels of effort from different people. Its name alone does not tell us how demanding it feels. Understanding that distinction helps readers interpret advice about exercise more accurately.

B One approach compares effort with a person's own fitness. The CDC calls this relative intensity. On a scale from zero to ten, zero means the effort needed to sit, while ten means the greatest possible effort. A score of five or six represents relatively **moderate** activity. Vigorous activity begins at seven or eight. An activity that feels vigorous to someone of average fitness can feel **moderate** to a very fit person. These scores describe effort, rather than age or sporting skill.

C The talk test offers another way to **recognize** the difference. During **moderate** exercise, a person can usually talk but cannot sing. During vigorous exercise, speaking more than a few words requires a pause for breath. This comparison does not require a watch. It connects a technical idea with an ordinary action. The CDC lists brisk walking and doubles tennis among **moderate** activities, while jogging and singles tennis appear among vigorous ones. Being **active** does not always mean working at the highest intensity.

D A second approach looks at the energy used during movement without considering someone's fitness. This is absolute intensity. Its unit compares an activity with sitting quietly. As work becomes harder, the amount of energy used increases. **Calories** also measure energy, but the two measures answer different questions. The CDC links to a separate table of energy used in common activities. A person's breathing and a table's estimate should not be treated as identical information about an exercise session.

Passage B - How Hard Is an Exercise Session?

E Time matters as well as effort. The CDC's adult guidance describes 150 minutes of **moderate** activity each week and muscle-strengthening activity on two days. The minutes can be divided across the week. Choosing enjoyable activities that match a person's abilities can make **regular exercise** easier to maintain. An activity diary can record the weekly total. This is guidance for adults, not the same target for every age group. It describes a routine within a **healthy lifestyle**, rather than a single demanding workout.

F Some people **suffer** from long-term conditions such as **heart disease**. The CDC advises them to discuss suitable types and amounts of activity with a doctor. Most people can do activity requiring **moderate** effort, but individual needs still matter. For someone with a **serious** health problem, an effort scale does not replace that discussion. Useful exercise information separates the intensity of movement, the time spent doing it, and the person's circumstances.
